

GHOST
la sella che non c'è

**Aligning the
panels**
before you start to ride

Align the panels

it is important to align the panels correctly, before you saddle your horse

- Before you ride, check the panels
- they must be parallel
- not too far forward
- not too far to the rear
- symmetrical

The correct position for the panels

it is easy to align them - see the next steps

Use the lines on the base

every base has 2 parallel lines at the bottom, you can place the panels against that line - this creates a normal spinal clearance for most horses

Again the lines

They are black, but clear to see

too narrow

too wide

not parallel

too far to the front

too far to the rear

not symmetrical

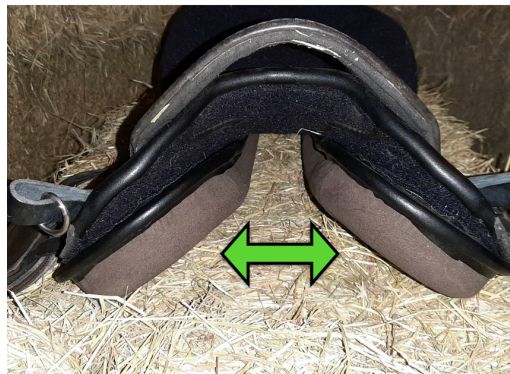

Spinal clearance

The spinal clearance should be about 4 fingers wide.

The panels widen

Under pressure the channel becomes wider - bear that in mind when you place the panels under the base

No pressure

The panels under pressure

As you can see the channel widens when there is weight in the saddle

With pressure

Always use panels

The Ghost is designed to have panels - never use it without!

- Don't remove both panels at the same time, you will have no reference anymore
- If you widen the panels, 1cm creates a 2cm extra width! That can be too much.
- If you want to move just the front or rear, do not remove them entirely, but lift just the front or rear end.
- When you are in doubt, always consult your dealer.
